

ABSTRACT OF THE DISCLOSURE

[0030] A multifunction product comprising a main machine, a flat bed for mounting a document on an upper part, a flat bed cover with one end being hinge-joined to the main machine, to open and close the flat bed, a scanner for scanning a document set on
5 the flat bed, and converting an optical signal obtained from the scanning into an electrical signal, a printing unit closely installed on the lower part of the scanner, a paper feeder for supplying a paper to the printing unit, and a discharged paper tray installed on one side of the main machine and formed at a predetermined sloping angle with respect to the mounting direction, to receive in the paper delivering direction. The
10 discharged paper tray is formed to receive a discharged paper so as to prevent possible damage to the paper which is usually weakened by the high temperature and high pressure of the printing unit.
